

# QChKAdC

QChKAdC is a desktop diamond verification instrument for loose and mounted diamonds, designed to separate diamonds from synthetic diamonds. QChKAdC is manually operated and requires an operator to interpret the test results.

After loading the sample in the aluminium plate it is exposed to deep UV and its phosphorescence and fluorescence are monitored in the windows. The Phosphorescence of some of the synthetic diamonds can be enhanced when the sample is kept at slightly higher temperature (approx 60-70 degrees C) which can be executed by placing the sample loaded metal plate on a vessel containing hot water.

QChKAdC makes a measurement and displays one of the following results:

- ◇ FI Image (Fluorescence)
- ◇ P Image (Phosphorescence)

From the observations and inference regarding Natural/Synthetic is by manual interpretation of the colour of Fluorescence and phosphorescence as per the Instruction manual supplied.
